

Release Notes

Version 1.0.0 — General Availability

This is the first General Availability release of the Attendance Management System: a multi-company desktop application for managing employee attendance, integrated with biometric devices, with a full Arabic-first interface.

Highlights

- Multi-company from day one. Run any number of independent companies from a single installation, each with completely isolated data, users, and settings.
- Enforced role-based access control. What a user can see and do is checked on every action, not just hidden in the menu — a role with view-only access to attendance genuinely cannot edit it, from either the desktop app or the optional REST API.
- Automatic, hands-off operation. Device synchronization and database backups run on a schedule in the background; no one needs to remember to click "Sync" or "Backup" every day.
- A complete attendance model. Shifts, holidays, and leave requests all feed into automatic daily attendance computation — present, late, absent, on leave, holiday, or weekend — with no manual reconciliation.
- Executive dashboard. At-a-glance company health plus a 14-day attendance trend and department headcount chart for a manager who wants the bigger picture without running a report.
- Data protection. Sensitive fields (salary, device credentials) are encrypted at rest, and database backups are encrypted end-to-end.
- Arabic-first, genuinely bilingual. Right-to-left layout, Arabic date and number formatting, and correctly shaped Arabic text in every exported PDF report — not an afterthought translation layer.
- Built for integration. An optional REST API (disabled by default) exposes the same company data over HTTP for organizations that want to connect their own tools, using the same permission model as the desktop app.

What's included in this release

Area	Capability
Employees & Departments	Records, search, hierarchical departments, branches, QR/barcode badges
Attendance	Device + manual punches, automatic daily status computation, shift/holiday/leave aware
Devices	ZKTeco (TCP/UDP) and Hikvision (ISAPI), connection testing, scheduled auto-sync
Reports	6 report types, Excel/PDF/CSV export, Arabic RTL PDF rendering

Area	Capability
Users & Roles	Per-company custom roles, granular permission catalog, audit log
Dashboard	Live stats, attendance trend chart, department breakdown chart
Backups	Manual + scheduled automatic backup, encrypted, WAL-safe
Licensing	Machine-bound activation, trial/subscription/lifetime license types
REST API	Optional, disabled by default, covers the same core data model

Upgrade notes

This is the first release — there is no upgrade path from a prior version. Installations of pre-release/development builds should treat this as a fresh install; contact your administrator before reusing an existing database file, since the schema is now managed by Alembic (see `alembic/README.md` if you maintain your own deployment).

Known limitations

- The REST API is a separate process from the desktop application; the desktop app does not need it running and does not start it automatically.
- Windows is the only packaged distribution target for this release (`Setup.exe` / `Portable.exe`); the application itself runs anywhere Python and PySide6 do, but only Windows builds are produced and tested as installable artifacts.
- Employee self-service (a login scoped to only an employee's own records) is not part of this release — every screen operates at full company scope, gated by role permissions.

Getting help

See the Installation Guide for setup, the User Guide for day-to-day operation, and the Administrator Guide for licensing, backups, roles, and troubleshooting.
